

SUJITH CHANDRAN

+91 8248635260 ◇ Kotagiri, The Nilgiris

sujjuchander@gmail.com ◇ <http://linkedin.com/in/sujithchandran1>

OBJECTIVE

DevOps Engineer with a strong interest in building reliable and efficient software delivery processes through automation and continuous improvement, seeking entry-level roles.

EDUCATION

Sri Ramakrishna Engineering College, Coimbatore
Bachelor of Electronics and Communication Engineering

Aug 2021-25
CGPA : 7.39

SKILLS

Cloud	AWS.
Containerization and Orchestration	Docker, Kubernetes.
CI/CD	Jenkins.
Programming and Database	Python, SQL.
Version Control and OS	Git, GitHub, Agile, Linux, Ubuntu.

EXPERIENCE

UI Bridge Solutions (UIB).
Embedded Hardware Intern

- Worked on Debugging Circuit-Level Issues in Embedded System Module Schematics.
- Designed a structured technical design document that outlines system components, data flow, and technical requirements.
- Worked on firmware part by interfacing Micro-controller, such as, STM32 and ESP32.

CERTIFICATION

"Devops Certification Course" at Pyspiders, Bangalore.

PROJECTS

Containerized Web Application Deployment.

Designed and containerized a full-stack application by developing custom Dockerfiles for frontend and back-end services. Orchestrated multi-container deployment using Docker Compose, enabling service communication and dependency handling.

Ensured consistent builds and reproducible environments, enhancing application portability, deployment efficiency.

Automated CI/CD Workflow with Docker and Jenkins on AWS.

Designed and deployed a production-grade CI/CD pipeline using AWS EC2, Jenkins, Docker, and Nginx for a full-stack application. Automated build, image push, and remote deployment via Docker Compose.

Implemented reverse proxy architecture, container orchestration, and storage optimization while resolving infrastructure, networking, and disk scalability challenges.

Predictive Maintenance for Industrial Machinery using LLM.

This project implements a smart predictive maintenance system using Large Language Models (LLMs) integrated with sensors. Real-time data from temperature, vibration, and current sensors is collected using a Raspberry Pi Pico W and sent to Firebase. The LLM analyzes this data to predict faults, diagnose issues, and recommend maintenance actions.
